

# Introduction to yFiles

**Problems:** No matter how great and destructive your problems may seem now, remember, you've probably only seen the tip of them.

# Overview

- yFiles
- Basic data structure
- Breadth First Search
- Simple layout algorithm
- CVS

# Tools

Books: Java in a Nutshell

IDE: Eclipse

# yFiles

- **Basic:** graph, geometry, ...
- **Layout:** abstract layout model, implementation
- **View:** graphical representation, I/O, ...
- **Extensions:** GraphML

Libraries: `y.jar`, `graphml.jar` and `crimson.jar`

## Simple Example – Linear List

### List member functions:■

- add element
- remove element
- get iterator

↪ API YList■

### Iterator functions:■

- get current element
- get next element
- is valid position

↪ API YCursor

## Example – Breadth First Search

**Input** : graph  $G = (V, E)$ , root node  $s \in V$

**Data** : queue  $Q$  (BFS front)  
          markers for nodes and edges

mark  $s$ ;

append  $Q \leftarrow s$ ;

**while**  $Q$  not empty **do**

    pop  $v \leftarrow Q$ ;

**foreach**  $e = (v, w) \in E$  not marked **do**

        mark  $e$ ;

**if**  $w$  is not marked **then**

            mark  $w$ ;

            append  $Q \leftarrow w$ ;

# Datastructures

- graph  $\longleftrightarrow$  Graph
- queue  $\longleftrightarrow$  YList
- marker  $\longleftrightarrow$  Node/Edge-Map

```
Graph graph;  
Node startNode;
```

```
NodeList queue;
```

```
NodeMap isVisited;  
EdgeMap isTraversed;
```

## BFS — Constructor

```
public BFS( Graph argG , Node args ){
    graph = argG;
    startNode = args;
    queue = new NodeList();
    isVisited = graph.createNodeMap();
    isTraversed = graph.createEdgeMap();

    for( NodeCursor V = G.nodes(); V.ok(); V.next() ){
        isVisited.setBool(V.node(), false);
    }
    for( EdgeCursor E = G.edges(); E.ok(); E.next() ){
        isTraversed.setBool(E.edge(), false);
    }
}
```

## BFS — Simple Auxiliary Functions

```
void markNode(Node v){  
    isVisited.setBoolean(v, true);  
}  
boolean isMarked(Node v){  
    return isVisited.getBoolean(v);  
}
```

...

```
void init(){  
    markNode(startNode);  
    queue.add(startNode);  
}
```

## BFS — Iteration

```
void iteration(){
    while( ! queue.isEmpty() ){
        Node v = queue.popNode();
        for(EdgeCursor N = v.edges(); N.ok(); N.next()){
            Edge e = N.edge();
            if( ! isMarked(e) ){
                markEdge(e);
                Node w = e.opposite(v);
                if( ! isMarked(w) ){
                    markNode(w);
                    queue.add(w);
                }
            }
        }
    }
}
```

## BFS — Algorithm

```
public void run(){  
    init();  
    iteration();  
}
```

```
public void run(Node otherStartNode){  
    startNode = otherStartNode;  
    init();  
    iteration();  
}
```

⇒ API: Graph    Node    NodeMap

# Layouts

Restricted scenario:

- assign coordinates to every node
- assign coordinates to every edge (polylines)

~> API: [CanonicMultiStageLayouter](#)

# Important Methods of CanonicalMultiStageLayouter

- canLayoutCore
- doLayoutCore

```
protected boolean canLayoutCore(LayoutGraph arg0) {  
    // test requirements  
    return true;  
}
```

## Simple Layout – Diagonal Placement

```
protected void doLayoutCore(LayoutGraph G) {  
  
    double offset = 0.0;  
    for(NodeCursor V = G.nodes() ; V.ok() ; V.next()){  
        Node v = V.node();  
        G.setLocation(v, offset , offset );  
        offset += 10.0;  
        offset += Math.max(G.getWidth(v),G.getHeight(v));  
    }  
}
```

## Simple Layout – Diagonal Placement (2)

```
for (EdgeCursor E = G.edges() ; E.ok() ; E.next()) {  
    Edge e = E.edge();  
    EdgeLayout el = G.getLayout(e);  
    el.clearPoints();  
    el.addPoint(  
        G.getCenterX(e.source()),  
        G.getCenterY(e.target()));  
}  
}
```

↔ API: [LayoutGraph](#)

## Integration of New Algorithm

YModule replaces 'public static void main(String args[])'

```
public class DiagonalLayoutModule extends LayoutModule {  
  
    public DiagonalLayoutModule() {  
        super("Demo", "MG", "DiagonalLayout");  
    }  
  
    protected void mainrun() {  
        DemoLayouter layouter = new DemoLayouter();  
        launchLayouter(layouter);  
    }  
}
```

## Integration of New YModule

- derive class from

`demo.yext.graphml.ViewActionDemo`

- override `createMenuBar`

```
protected JMenuBar createMenuBar() {
    JMenuBar bar = super.createMenuBar();
    JMenu menu = new JMenu("Layout");
    menu.add(new LaunchModule(new DiagonalLayoutModule()));
    bar.add(menu);
    return bar;
}
```

## Integration of New YModule (2)

- put `path_to_yfiles/demo/yed/yed.jar` into CLASSPATH
- create `tools.pkg` in `~/ .yed` with

```
<PACKAGE name="PACKAGE_TOOLS">  
  <MODULE name=" DiagonalLayoutModule"  
    class=" package . DiagonalLayoutModule">  
  </MODULE>  
</PACKAGE>
```
- use `java yed.Launcher`

# CVS

CVS = Concurrent Versions System

- **secure tunnel:**

```
ssh -N -L 2401:i11raid.ira.uka.de:2402 algoprakt@i11raid.ira.uka.de
```

- **repository:**

```
/home/algo/lehre/cvsroot
```

- **commands:**

```
add, checkout, commit, login, update
```
